Problem Description

There are N chocolates denoted by array A where $A[i]$ is the length of the i -th chocolate.

Alice can melt each chocolate and then convert it into a chocolate whose length is any divisor of the number $A[i]$.

So, a chocolate of length $A[i]$ can be converted into X different types of chocolate where X is the count of divisors of the number $A[i]$.

So you need to count the total unordered pair of chocolates such that their X value is same.

Constraints

$1 \leq N \leq 10^5$
 $1 \leq A[i] \leq 10^6$

Input Format

The first line contains an integer N as input denoting the total number of elements in the array A .

The next line contains N space-separated integers that denote the elements of the array A .

Output Format

In the output, print the total number of ways as mentioned in the statement.
